Abstract

MULTI-LINGUAL USER INTERFACE CONTROL

When a clerk enters order data into the appropriate fields of an order form, the data is stored in a first language in a local database. Then, for example, an e-mail is automatically sent to a different location (and second language) country which will fulfill the order. Upon receiving the e-mail, the fulfillment location country queries the remote (to them) database in the second language to view the order. When the first language order data is placed in the form and prior to presenting it to the user for viewing, Machine Translation would be invoked to translate the data to the second language of the user. The order is then processed.
